

ALDEHYDE

Thank You for Using Aldehyde Wordpress theme.
© InkHive.com 2013.

This Documentation Contains only basic things at which we think you might get stuck. For further support please use the dedicated [support forum for Aldehyde](#) at inkhive.com

Using the Dropdown Menu

Aldehyde theme uses a Mobile Friendly DropDown Menu. Here are some of the features.

- Dropdown works Normally on Devices with width greater than 768px.(PCs, Laptops)
- For Click/Touch Bases devices, the menu converts into a select box. Because, there is no hover in iPad, Android, iPhone, etc.
- The theme supports upto 2 Levels of DropDown Menus.

How to enable the Slider?

Aldehyde supports upto 5 Sliders which can be purely images, or images with some heading and a tagline. To use Slider go to Dashboard > Appearance > Aldehyde Settings > Slider Settings.

There you will see options to add 5 sliders. Add the no. of sliders you want to use. Leave the rest blank. For example if you want to use 3 sliders then set up the options for first 3 sliders only.

If you do not want Heading/Tagline for a Slide, leave them blank. But, if you use a Heading it is must to use an URL. As Heading will be linking to an URL.

Using the Slider on Static Front Page

Aldehyde will show the slider on the homepage(your latest blog posts) by default. To disable it, you can deactivate the slider from Aldehyde Settings.

To enable Slider on a static front page you are using, go to Edit Pages, select the static front page you are using and set the Page Template to: "Default Template with Slider".

Using Slider on Individual Pages

Aldehyde theme supports addition of sliders to pages. To do so, simply go to the page where you

would like to display the slider. Click on Edit Page from the WordPress Admin Bar.

Once you are editing the page. On the right you will see an option to change the default templates. To use slider there are 2 options.

- Default Template with Slider - This will show a sidebar on your page.
- Full Width Page with Slider - This will not show a sidebar on the page.

Using Image Thumbnails

If the size of your image thumbnails, doesn't fit the container. Then read this carefully.

Aldehyde implements thumbnail functionality using featured images. So, if you are coming from some other theme then I recommend you to install the [Regenerate Thumbnails](#) plugin and use it to regenerate all the thumbnails with the Aldehyde theme already activated. This will not affect or harm your original images in any way.

If you do not regenerate your thumbnails, then the images will appear ugly as hell. You need not use this plugin if you are using Aldehyde on a New Wordpress site.

Everything else is self-explanatory in the theme. To report bugs or support for this theme, please use [support forum for Aldehyde](#).
